HavenPath NY — Climate-Resilient Urban Walking Navigation

Team Members

Zhaoxi Chen

Design & Technology
rendered app/website
with ai tools,
including animations,
interactions and
functionality.

Baihe Fu

Communication
Designer
Designed in-app
layout, visual
formatting, and user
experience.

Jessica Hsiao

Software Engineer
Designed the web
app's decision logic
and wired the
datasets behind the
route scoring.

Lei Hao

Biomedical Engineer
Provided healthcare
related ideas and
contribute to the
feature testing.

Weiming He

Computer Engineer
built the agent loops
and the data fetching
pipelines to
implement intelligent
customization

What is the problem we are targeting to solve?

01. Making time in nature part of everyday health

Current mapping tools fail to protect urban pedestrians from climate hazards, offering zero adaptation for individuals with special health conditions like asthma.

Target Audience: People with climate-sensitive health needs — such as asthma, heat sensitivity, respiratory conditions, or other individual health vulnerabilities.

What is our solution?

HavenPath is an AI-powered, climate-aware navigation platform.

It adapts routes to each user's health sensitivities. It considers heat, air quality, shade, sun exposure.

Ask Haven turns this data into simple, personalized guidance.

Considers parameters within UX/UI design.

Why is it meaningful?

Climate risk is personal. A temperature, AQI level, or walking route that is manageable for one person may create significantly different concerns for someone with asthma, heat sensitivity, or another health vulnerability. Yet today's navigation tools largely treat every traveler the same.

HavenPath turns fragmented climate and health information into personalized decisions people can actually use in everyday life.

Hackathon

How does it work?

Users can explore HavenPath instantly or create an account to save their health sensitivities, accessibility needs, and preferences. After entering a destination, HavenPath compares route conditions like heat, air quality, shade, etc to recommend a more suitable route with AI guidance.

Tools and data used: Codex, Claude, Gemini, provided data/other datasets.

What would we do with more support?

With more support, we would validate HavenPath with people who have asthma, heat sensitivity, and other climate-sensitive health needs; integrate additional real-time environmental and accessibility data; and test whether our recommendations meaningfully reduce exposure during everyday travel.

We would then expand HavenPath beyond NYC into a scalable climate-health navigation layer that could integrate with existing mapping, transportation, healthcare, and public-health platforms.
